ABSTRACT OF THE DISCLOSURE

A message exchanging method enables simple interactions between two users during message
5   exchanges and enables one-to-one interactions to shift to interactions between three or more users. Upon receiving a message from a third person while two users are exchanging messages using a messenger, a client machine requests a server to open a chat room.
10 The client that connects to a chat room activates a chat application using the messenger to allow the users to engage in a chat.
